

## ACYLATED INSULIN

### CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation-in-part of application serial no. 08/400,256 filed March 8, 1995 which is a continuation-in-part of serial no. 08/190,829 filed February 2, 1994, now abandoned, and serial no. PCT/DK94/00347 filed September 16, 1994, now abandoned, which claims priority under 35 U.S.C. 119 of Danish application no. 1044/93 filed September 17, 1993, the contents of which are fully incorporated herein by reference.

### FIELD OF THE INVENTION

The present invention relates to novel human insulin derivatives which are soluble and have a protracted profile of action, to a method of providing such derivatives, to pharmaceutical compositions containing them, and to the use of such insulin derivatives in the treatment of diabetes.

### BACKGROUND OF THE INVENTION

Many diabetic patients are treated with multiple daily insulin injections in a regimen comprising one or two daily injections of a protracted insulin to cover the basal requirement supplemented by bolus injections of a rapid acting insulin to cover the requirement related to meals.

Protracted insulin compositions are well known in the art. Thus, one main type of protracted insulin compositions comprises injectable aqueous suspensions of insulin crystals or amorphous insulin. In these compositions, the insulin compounds utilized typically are protamine insulin, zinc insulin or protamine zinc insulin.

Certain drawbacks are associated with the use of insulin suspensions. Thus, in order to secure an accurate dosing, the insulin particles must be suspended homogeneously by

While it was earlier believed that protamines were non-immunogenic, it has now turned out that protamines can be immunogenic in man and that their use for medical purposes may lead to formation of antibodies (Samuel et al., Studies on the immunogenicity of protamines in humans and experimental animals by means of a micro-complement fixation test, Clin. Exp. Immunol. 33, pp. 252-260 (1978)).

Also, evidence has been found that the protamine-insulin complex is itself immunogenic (Kurtz et al., Circulating IgG antibody to protamine in patients treated with protamine-insulins. Diabetologica 25, pp. 322-324 (1983)). Therefore, with some patients the use of protracted insulin compositions containing protamines must be avoided.

Another type of protracted insulin compositions are solutions having a pH value below physiological pH from which the insulin will precipitate because of the rise in the pH value when the solution is injected. A drawback with these solutions is that the particle size distribution of the precipitate formed in the tissue on injection, and thus the timing of the medication, depends on the blood flow at the injection site and other parameters in a somewhat unpredictable manner. A further drawback is that the solid particles of the insulin may act as a local irritant causing inflammation of the tissue at the site of injection.

WO 91/12817 (Novo Nordisk A/S) discloses protracted, soluble insulin compositions comprising insulin complexes of cobalt(III). The protraction of these complexes is only intermediate and the bioavailability is reduced.

Human insulin has three primary amino groups: the N-terminal group of the A-chain and of the B-chain and the  $\epsilon$ -amino group of Lys<sup>B29</sup>. Several insulin derivatives which are substituted in one or more of these groups are known in the prior art. Thus, US Patent No. 3,528,960 (Eli Lilly) relates to N-carboxyaroyl insulins in which one, two or three primary amino groups of the insulin molecule has a carboxyaroyl group. No specifically N<sup>B29</sup>-substituted insulins are disclosed.

According to GB Patent No. 1,492,997 (Nat. Res. Dev. Corp.), it has been found that insulin with a carbamyl substitution at N<sup>B29</sup> has an improved profile of hypoglycaemic effect.

JP laid-open patent application No. 1-254699 (Kodama Co., Ltd.) discloses insulin wherein a fatty acid is bound to the insulin molecule.

Insulins, which in the B30 position have an amino acid having at least five carbon atoms which cannot necessarily be coded for by a triplet of nucleotides, are described in JP laid-open patent application No. 57-067548 (Shionogi). The insulin analogues are claimed to be useful in the treatment of diabetes mellitus, particularly in patients who are insulin resistant due to generation of bovine or swine insulin antibodies.

By "insulin derivative" as used herein is meant a compound having a molecular structure similar to that of human insulin including the disulfide bridges between Cys<sup>A7</sup> and Cys<sup>B7</sup> and between Cys<sup>A20</sup> and Cys<sup>B19</sup> and an internal disulfide bridge between Cys<sup>A6</sup> and Cys<sup>A11</sup>, and which have insulin activity.

However, there still is a need for protracted injectable insulin compositions which are solutions and contain insulins which stay in solution after injection and possess minimal inflammatory and immunogenic properties.

One object of the present invention is to provide human insulin derivatives, with a protracted profile of action, which are soluble at physiological pH values.

Another object of the present invention is to provide a pharmaceutical composition comprising the human insulin derivatives according to the invention.

It is a further object of the invention to provide a method of making the human insulin derivatives of the invention.

## SUMMARY OF THE INVENTION

Surprisingly, it has turned out that certain human insulin derivatives, wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent, have a protracted profile of action and are soluble at physiological pH values

Accordingly, in its broadest aspect, the present invention relates to an insulin derivative having the following sequence:

A-Chain (contd.)

Leu-Tyr-Gln-Leu-Glu-Asn-Tyr-Cys-Xaa (SEQ ID NO:1)  
13 14 15 16 17 18 19 20 21

B-Chain (contd.)

Glu-Ala-Leu-Tyr-Leu-Val-Cys-Gly-Glu-Arg-Gly-Phe-  
13 14 15 16 17 18 19 20 21 22 23 24

B-Chain (contd.)

Phe-Tyr-Thr-Pro-Lys-Xaa (SEQ ID NO:2)  
25 26 27 28 29 30

wherein

Xaa at positions A21 and B3 are, independently, any amino acid residue which can be coded for by the genetic code except Lys, Arg and Cys;

Xaa at position B1 is Phe or is deleted;

Xaa at position B30 is (a) a non-codable, lipophilic amino acid having from 10 to 24 carbon atoms, in which case an acyl group of a carboxylic acid with up to 5 carbon atoms is bound to the  $\epsilon$ -amino group of Lys<sup>B29</sup>, (b) any amino acid residue which can be coded for by the genetic code except Lys, Arg and Cys, in which case the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent or (c) deleted, in which case the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent; and any Zn<sup>2+</sup> complexes thereof, provided that when Xaa at position B30 is Thr or Ala, Xaa at positions A21 and B3 are both Asn, and Xaa at position B1 is Phe, then the insulin derivative is a Zn<sup>2+</sup> complex.

In one preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid residue is deleted or is any amino acid residue which can be coded for by the genetic code except Lys, Arg and Cys; the A21 and the B3 amino acid residues are, independently, any amino acid residues which can be coded for by the genetic code except Lys, Arg and Cys; Phe<sup>B1</sup> may be deleted; the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which comprises at least 6 carbon atoms; and 2-4 Zn<sup>2+</sup> ions may be bound to each insulin hexamer with the proviso that when B30 is Thr or Ala and A21 and B3 are both Asn,

5 coded for by the genetic code except Lys, Arg and Cys; the A21 and the B3 amino acid residues are, independently, any amino acid residues which can be coded for by the genetic code except Lys, Arg and Cys, with the proviso that if the B30 amino acid residue is Ala or Thr, then at least one of the residues A21 and B3 is different from Asn; Phe<sup>B1</sup> may be deleted; and the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which comprises at least 6 carbon atoms.

10 In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid residue is deleted or is any amino acid residue which can be coded for by the genetic code except Lys, Arg and Cys; the A21 and the B3 amino acid residues are, independently, any amino acid residues which can be coded for by the genetic code except Lys, Arg and Cys; Phe<sup>B1</sup> may be deleted; the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which comprises at least 6 carbon atoms; and 2-4 Zn<sup>2+</sup> ions are bound to each insulin hexamer.

15 In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid residue is deleted.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid residue is Asp.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid residue is Glu.

20 In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid residue is Thr.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is a lipophilic amino acid having at least 10 carbon atoms.

25 In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is a lipophilic  $\alpha$ -amino acid having from 10 to 24 carbon atoms.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is a straight chain, saturated, aliphatic  $\alpha$ -amino acid having from 10 to 24 carbon atoms

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino decanoic acid

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino undecanoic acid.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino dodecanoic acid.

5 In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino tridecanoic acid.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino tetradecanoic acid.

10 In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino pentadecanoic acid.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is  $\alpha$ -amino hexadecanoic acid.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B30 amino acid is an  $\alpha$ -amino acid.

15 In another preferred embodiment, the invention relates to a human insulin derivative in which the A21 amino acid residue is Ala.

In another preferred embodiment, the invention relates to a human insulin derivative in which the A21 amino acid residue is Gln.

20 In another preferred embodiment, the invention relates to a human insulin derivative in which the A21 amino acid residue is Gly.

In another preferred embodiment, the invention relates to a human insulin derivative in which the A21 amino acid residue is Ser.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B3 amino acid residue is Asp.

25 In another preferred embodiment, the invention relates to a human insulin derivative in which the B3 amino acid residue is Gln.

In another preferred embodiment, the invention relates to a human insulin derivative in which the B3 amino acid residue is Thr.

In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an acyl group, branched or unbranched, which corresponds to a carboxylic acid having a chain of carbon atoms 8 to 24 atoms long.

5 In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an acyl group corresponding to a fatty acid having at least 6 carbon atoms.

10 In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an acyl group corresponding to a linear, saturated carboxylic acid having from 6 to 24 carbon atoms.

In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an acyl group corresponding to a linear, saturated carboxylic acid having from 8 to 12 carbon atoms.

15 In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an acyl group corresponding to a linear, saturated carboxylic acid having from 10 to 16 carbon atoms.

In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an oligo oxyethylene group comprising up to 10, preferably up to 5, oxyethylene units.

20 In another preferred embodiment, the invention relates to a human insulin derivative in which the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a lipophilic substituent which is an oligo oxypropylene group comprising up to 10, preferably up to 5, oxypropylene units.

In another preferred embodiment, the invention relates to a human insulin derivative in which each insulin hexamer binds 2 Zn<sup>2+</sup> ions.

25 In another preferred embodiment, the invention relates to a human insulin derivative in which each insulin hexamer binds 3 Zn<sup>2+</sup> ions.

In another preferred embodiment, the invention relates to a human insulin derivative in which each insulin hexamer binds 4 Zn<sup>2+</sup> ions.

In another preferred embodiment,

In another preferred embodiment, the invention relates to a pharmaceutical composition for the treatment of diabetes in a patient in need of such a treatment comprising a therapeutically effective amount of a human insulin derivative according to the invention together with a pharmaceutically acceptable carrier.

5 In another preferred embodiment, the invention relates to a pharmaceutical composition for the treatment of diabetes in a patient in need of such a treatment comprising a therapeutically effective amount of a human insulin derivative according to the invention, in mixture with an insulin or an insulin analogue which has a rapid onset of action, together with a pharmaceutically acceptable carrier.

10 In another preferred embodiment, the invention relates to a pharmaceutical composition comprising a human insulin derivative according to the invention which is soluble at physiological pH values.

In another preferred embodiment, the invention relates to a pharmaceutical composition comprising a human insulin derivative according to the invention which is  
15 soluble at pH values in the interval from about 6.5 to about 8.5.

In another preferred embodiment, the invention relates to a protracted pharmaceutical composition comprising a human insulin derivative according to the invention.

In another preferred embodiment, the invention relates to a pharmaceutical composition which is a solution containing from about 120 nmol/ml to about 1200 nmol/ml,  
20 preferably about 600 nmol/ml of a human insulin derivative according to the invention.

In another preferred embodiment, the invention relates to a method of treating diabetes in a patient in need of such a treatment comprising administering to the patient a therapeutically effective amount of an insulin derivative according to this invention together with a pharmaceutically acceptable carrier.

25 In another preferred embodiment, the invention relates to a method of treating diabetes in a patient in need of such a treatment comprising administering to the patient a therapeutically effective amount of an insulin derivative according to this invention, in mixture with an insulin or an insulin analogue which has a rapid onset of action, together with a pharmaceutically acceptable carrier.

N- $\beta$ -tridecanoyl-L-10-BSA-human insulin.

N<sup>ε</sup>B<sup>29</sup>-tetradecanoyl des(B30) human insulin.

N<sup>ε</sup>B<sup>29</sup>-decanoyl des(B30) human insulin.

## BRIEF DESCRIPTION OF THE DRAWINGS

The present invention is further illustrated with reference to the appended drawings wherein

Fig. 1 shows the construction of the plasmid pEA5.3.2;

Fig. 2 shows the construction of the plasmid pEA108; and

Fig. 3 shows the construction of the plasmid pEA113.

## DETAILED DESCRIPTION OF THE INVENTION

### Terminology

The three letter codes and one letter codes for the amino acid residues used herein are those stated in J. Biol. Chem. 243, p. 3558 (1968).

In the DNA sequences, A is adenine, C is cytosine, G is guanine, and T is thymine.

The following acronyms are used:

DMSO for dimethyl sulphoxide, DMF for dimethylformamide, Boc for *tert*-butoxycarbonyl, RP-HPLC for reversed phase high performance liquid chromatography, X-OSu is an N-hydroxysuccinimid ester, X is an acyl group, and TFA for trifluoroacetic acid.

### Preparation of lipophilic insulin derivatives

The insulin derivatives according to the present invention can be prepared i.a. as described in the following:

1. Insulin derivatives featuring in position B30 an amino acid residue which can be coded for by the genetic code, e.g. threonine (human insulin) or alanine (porcine insulin).

#### 1.1 Starting from human insulin.

Human insulin is treated with a Boc-reagent (e.g. di-*tert*-butyl dicarbonate) to form (A1,B1)-diBoc human insulin, i.e., human insulin in which the N-terminal end of both chains

introduced. In the final step, TFA is used to remove the Boc-groups and the product, N<sup>B29</sup>-X human insulin, is isolated.

### 1.2 Starting from a single chain insulin precursor.

5 A single chain insulin precursor, extended in position B1 with an extension (Ext) which is connected to B1 via an arginine residue and in which the bridge from B30 to A1 is an arginine residue, i.e. a compound of the general formula Ext-Arg-B(1-30)-Arg-A(1-21), can be used as starting material. Acylation of this starting material with a N-hydroxysuccinimide ester of the general formula X-OSu wherein X is an acyl group,  
10 introduces the acyl group X in the  $\epsilon$ -amino group of Lys<sup>B29</sup> and in the N-terminal amino group of the precursor. On treating this acylated precursor of the formula (N<sup>B29</sup>-X),X-Ext-Arg-B(1-30)-Arg-A(1-21) with trypsin in a mixture of water and a suitable water-miscible organic solvent, e.g. DMF, DMSO or a lower alcohol, an intermediate of the formula (N<sup>B29</sup>-X),Arg<sup>B31</sup> insulin is obtained. Treating this intermediate with carboxypeptidase B yields the  
15 desired product, (N<sup>B29</sup>-X) insulin.

## 2. Insulin derivatives with no amino acid residue in position B30, i.e. des(B30) insulins.

### 2.1 Starting from human insulin or porcine insulin.

20 On treatment with carboxypeptidase A in ammonium buffer, human insulin and porcine insulin both yield des(B30) insulin. After an optional purification, the des(B30) insulin is treated with a Boc-reagent (e.g. di-*tert*-butyl dicarbonate) to form (A1,B1)-diBoc des(B30) insulin, i.e., des(B30) insulin in which the N-terminal end of both chains are protected by a Boc-group. After an optional purification, e.g. by HPLC, an acyl group is introduced in the  $\epsilon$ -amino group of Lys<sup>B29</sup> by allowing the product to react with a N-hydroxysuccinimide ester of the formula X-OSu wherein X is the acyl group to be  
25 introduced. In the final step, TFA is used to remove the Boc-groups and the product, (N<sup>B29</sup>-X) des(B30) insulin, is isolated.

A single chain insulin precursor, extended in position B1 with an extension (Ext) which is connected to B1 via an arginine residue and which has a bridge from B30 to A1 can be a useful starting material. Preferably, the starting material is a compound of the general formula Ext-Arg-B(1-30)-Arg-A(1-21).

$Y_n$ -Arg, where Y is a codable amino acid except lysine and arginine, and n is zero or an integer between 1 and 35. When  $n > 1$ , the Y's may designate different amino acids. Preferred examples of the bridge from B30 to A1 are: AlaAlaArg, SerArg, SerAspAspAlaArg and Arg (European Patent No. 163529). Treatment of such a precursor  
 5 of the general formula Ext-Arg-B(1-30)- $Y_n$ -Arg-A(1-21) with a lysyl endopeptidase, e.g. *Achromobacter lyticus* protease, yields Ext-Arg-B(1-29) Thr- $Y_n$ -Arg-A(1-21) des(B30) insulin. Acylation of this intermediate with a N-hydroxysuccinimide ester of the general formula X-OSu wherein X is an acyl group, introduces the acyl group X in the  $\epsilon$ -amino group of Lys<sup>B29</sup>, and in the N-terminal amino group of the A-chain and the B-chain to give  
 10 ( $N^{\epsilon B29}$ -X) X-Ext-Arg-B(1-29) X-Thr- $Y_n$ -Arg-A(1-21) des(B30) insulin. This intermediate on treatment with trypsin in mixture of water and a suitable organic solvent, e.g. DMF, DMSO or a lower alcohol, gives the desired derivative, ( $N^{\epsilon B29}$ -X) des(B30) human insulin.

#### Data on $N^{\epsilon B29}$ modified insulins.

15 Certain experimental data on  $N^{\epsilon B29}$  modified insulins are given in Table 1.

The lipophilicity of an insulin derivative relative to human insulin,  $k'_{rel}$ , was measured on a LiChrosorb RP18 (5 $\mu$ m, 250x4 mm) HPLC column by isocratic elution at 40°C using mixtures of A) 0.1 M sodium phosphate buffer, pH 7.3, containing 10% acetonitrile, and B) 50% acetonitrile in water as eluents. The elution was monitored by following the UV  
 20 absorption of the eluate at 214 nm. Void time,  $t_0$ , was found by injecting 0.1 mM sodium nitrate. Retention time for human insulin,  $t_{human}$ , was adjusted to at least  $2t_0$  by varying the ratio between the A and B solutions.  $k'_{rel} = (t_{derivative} - t_0) / (t_{human} - t_0)$ .

25 The degree of prolongation of the blood glucose lowering effect was studied in rabbits. Each insulin derivative was tested by subcutaneous injection of 12 nmol thereof in each of six rabbits in the single day retardation test. Blood sampling for glucose analysis was performed before injection and at 1, 2, 4 and 6 hours after injection. The glucose values found are expressed as percent of initial values. The Index of Protraction, which was calculated from the blood glucose values, is the scaled Index of Protraction calculation:

The insulin derivatives listed in Table 1 were administered in solutions containing 3  $\text{Zn}^{2+}$  per insulin hexamer, except those specifically indicated to be Zn-free.

For the very protracted analogues the rabbit model is inadequate because the decrease in blood glucose from initial is too small to estimate the index of protraction. The  
5 prolongation of such analogues is better characterized by the disappearance rate in pigs.  $T_{50\%}$  is the time when 50% of the A14 Tyr( $^{125}\text{I}$ ) analogue has disappeared from the site of injection as measured with an external  $\gamma$ -counter (Ribel, U et al., The Pig as a Model for Subcutaneous Absorption in Man. In: M. serrano-Rios and P.J. Lefebvre (Eds): Diabetes 1985; Proceedings of the 12th Congress of the International Diabetes Federation, Madrid,  
10 Spain, 1985 (Excerpta Medica, Amsterdam, (1986) 891-96).

In Table 2 are given the  $T_{50\%}$  values of a series of very protracted insulin analogues. The analogues were administered in solutions containing 3  $\text{Zn}^{2+}$  per insulin hexamer.

Table 1

| Insulin derivative *) | Relative Lipophilicity | Blood glucose, % of initial |      |       |      | Index of protraction |
|-----------------------|------------------------|-----------------------------|------|-------|------|----------------------|
|                       |                        | 1 h                         | 2 h  | 4 h   | 6 h  |                      |
| benzoyl               | 1.14                   |                             |      |       |      |                      |
| phenyl                | 1.28                   | 55.4                        | 58.9 | 88.8  | 90.1 | 10                   |

### Solubility

The solubility of all the N<sup>B29</sup> modified insulins mentioned in Table 1, which contain 3  $Zn^{2+}$  ions per insulin hexamer, exceeds 600 nmol/ml in a neutral (pH 7.5), aqueous, pharmaceutical formulation which further comprises 0.3% phenol as preservative, and 1.6%

the  $\alpha$ -glutamyl group of the N<sup>B29</sup> modified insulin is substituted with a carboxamide, a thiocarbamide, or a carbamate. The lipophilic substituent carried by the  $\gamma$ -B29

Pharmaceutical compositions containing a human insulin derivative according to the present invention may be administered parenterally to patients in need of such a treatment. Parenteral administration may be performed by subcutaneous, intramuscular or intravenous injection by means of a syringe, optionally a pen-like syringe. Alternatively, parenteral  
5 administration can be performed by means of an infusion pump. A further option is a composition which may be a powder or a liquid for the administration of the human insulin derivative in the form of a nasal spray.

The injectable human insulin compositions of the invention can be prepared using the conventional techniques of the pharmaceutical industry which involves dissolving and mixing  
10 the ingredients as appropriate to give the desired end product.

Thus, according to one procedure, the human insulin derivative is dissolved in an amount of water which is somewhat less than the final volume of the composition to be prepared. An isotonic agent, a preservative and a buffer is added as required and the pH value of the solution is adjusted - if necessary - using an acid, e.g. hydrochloric acid, or a  
15 base, e.g. aqueous sodium hydroxide as needed. Finally, the volume of the solution is adjusted with water to give the desired concentration of the ingredients.

Examples of isotonic agents are sodium chloride, mannitol and glycerol.

Examples of preservatives are phenol, m-cresol, methyl p-hydroxybenzoate and benzyl alcohol.

20 Examples of suitable buffers are sodium acetate and sodium phosphate.

A composition for nasal administration of an insulin derivative according to the present invention may, for example, be prepared as described in European Patent No. 272097 (to Novo Nordisk A/S).

The insulin compositions of this invention can be used in the treatment of diabetes.  
25 The optimal dose level for any patient will depend on a variety of factors including the efficacy of the specific human insulin derivative employed, the age, body weight, physical activity, and diet of the patient, on a possible combination with other drugs, and on the severity of the case of diabetes. It is necessary to follow the advice of a physician in the use of the compositions of this invention.

Where expedient, the human insulin derivative of this invention may be used in

the European patent applications having the publication Nos. EP 214826 (Novo Nordisk A/S), EP 375437 (Novo Nordisk A/S) and EP 383472 (Eli Lilly & Co.).

The present invention is further illustrated by the following examples which, however, are not to be construed as limiting the scope of protection. The features disclosed in the foregoing description and in the following examples may, both separately and in any combination thereof, be material for realizing the invention in diverse forms thereof.

## EXAMPLES

### Plasmids and DNA material

All expression plasmids are of the cPOT type. Such plasmids are described in EP patent application No. 171 142 and are characterized in containing the Schizosaccharomyces pombe triose phosphate isomerase gene (POT) for the purpose of plasmid selection and stabilization. A plasmid containing the POT-gene is available from a deposited E. coli strain (ATCC 39685). The plasmids furthermore contain the S. cerevisiae triose phosphate isomerase promoter and terminator ( $P_{TPI}$  and  $T_{TPI}$ ). They are identical to pMT742 (Egel-Mitani, M. et al., Gene 73 (1988) 113-120) (see Fig. 1) except for the region defined by the EcoRI-XbaI restriction sites encompassing the coding region for signal/leader/product.

Synthetic DNA fragments were synthesized on an automatic DNA synthesizer (Applied Biosystems model 380A) using phosphoramidite chemistry and commercially available reagents (Beaucage, S.L. and Caruthers, M.H., Tetrahedron Letters 22 (1981) 1859-1869).

All other methods and materials used are common state of the art knowledge (see, e.g. Sambrook, J., Fritsch, E.F. and Maniatis, T., Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory Press, New York, 1989).

### Analytical

Molecular masses of the insulins prepared were obtained by MS (mass spectroscopy), either by PDMS (plasma desorption mass spectrometry) using a Rix Ion 20 instrument or by

## EXAMPLE 1

Synthesis of Ala<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor from Yeast strain yEA002 using the LaC212spx3 signal/leader

The following oligonucleotides were synthesized:

5 #98 5' - TGGCTAAGAGATTGTTGACCAACACTTGTGCGGTTCTCACTTGGTTGAA  
GCTTTGTACTTGGTTTGTGGTGAAAGAGGTTTCTTCTACACTCCAAAGTCTGA  
CGACGCT-3' (Asp<sup>B3</sup>) (SEQ ID NO:3)

#128 5' - CTGCGGGCTGCGTCTAAGCACAGTAGTTTTCCAATTGGTACAAAGAACAG  
ATAGAAGTACAACATTGTTCAACGATACCCCTTAGCGTCGTCAGACTTTGG-3'  
10 (Ala<sup>A21</sup>) (SEQ ID NO:4)

#126 5' - GTGCGCATGGCTAAGAGATTGTTG-3' (Asp<sup>B3</sup>) (SEQ ID NO:5)

#16 5' - CTGCTCTAGAGCCCTGCGGGCTGCGTCT-3' (SEQ ID NO:6)

The following Polymerase Chain Reaction (PCR) was performed using the Gene Amp  
PCR reagent kit (Perkin Elmer, 761 Main Avewalk, CT 06859, USA) according to the  
15 manufacturer's instructions. In all cases, the PCR mixture was overlaid with 100 µl of  
mineral oil (Sigma Chemical Co., St. Louis, MO, USA).

2.5 µl of oligonucleotide #98 (2.5 pmol)

2.5 µl of oligonucleotide #128 (2.5 pmol)

20 10 µl of 10X PCR buffer

16 µl of dNTP mix

0.5 µl of Taq enzyme

58.5 µl of water

25 One cycle was performed: 94°C for 45 sec., 49°C for 1 min, 72°C for 2 min.

Subsequently, 5µl of oligonucleotides #16 and #126 was added and 15 cycles were  
performed: 94°C for 45 sec., 45°C for 1 min, 72°C for 1.5 min. The PCR mixture was  
loaded onto a 2.5 % agarose gel and subjected to electrophoresis using standard techniques  
(Sambrook et al., Molecular cloning, Cold Spring Harbour Laboratory Press, 1989). The

manufacturer's instructions. The purified PCR DNA fragment was dissolved in 10 µl of  
water and restriction endonuclease buffer, gel loading with the restriction endonuclease, Nde I and

The plasmid pAK188 consists of a DNA sequence of 412 bp composed of a EcoRI/NcoI fragment encoding the synthetic yeast signal/leader gene LaC212spx3 (described in Example 3 of WO 89/02463) followed by a synthetic NcoI/XbaI fragment encoding the insulin precursor MI5, which has a SerAspAspAlaLys bridge connecting the B29 and the A1 amino acid residues (see SEQ ID NOS. 14, 15 and 16), inserted into the EcoRI/XbaI fragment of the vector (phagemid) pBLUESCRIPT II sk(+/-) (Stratagene, USA). The plasmid pAK188 is shown in Fig. 1.

The plasmid pAK188 was also cut with the restriction endonucleases NcoI and XbaI and the vector fragment of 3139 bp isolated. The two DNA fragments were ligated together using T4 DNA ligase and standard conditions (Sambrook et al., Molecular Cloning, Cold Spring Harbour Laboratory Press, 1989). The ligation mixture was transformed into a competent *E. coli* strain (R-, M+) followed by selection for ampicillin resistance. Plasmids were isolated from the resulting *E. coli* colonies using standard DNA miniprep technique (Sambrook et al., Molecular Cloning, Cold Spring Harbour Laboratory Press, 1989), checked with appropriate restrictions endonucleases i.e. EcoRI, Xba I, NcoI and HpaI. The selected plasmid was shown by DNA sequencing analyses (Sequenase, U.S. Biochemical Corp.) to contain the correct sequence for the Ala<sup>A21</sup>, Asp<sup>B3</sup> human insulin precursor and named pEA5.3.

The plasmid pKFN1627 is an *E. coli* - *S. cerevisiae* shuttle vector, identical to plasmid pKFN1003 described in EP patent No. 375718, except for a short DNA sequence upstream from the unique XbaI site. In pKFN1003, this sequence is a 178 bp fragment encoding a synthetic aprotinin gene fused in-frame to the yeast mating factor alpha 1 signal-leader sequence. In pKFN1627, the corresponding 184 bp sequence encodes the insulin precursor MI5 (Glu<sup>B1</sup>, Glu<sup>B28</sup>) (i.e. B(1-29, Glu<sup>B1</sup>, Glu<sup>B28</sup>)-SerAspAspAlaLys-A(1-21) fused in-frame to the mating factor alpha 1 sequence (see SEQ ID NOS. 17, 18 and 19). The vector pKFN1627 is shown in Fig. 1.

pEA5.3 was cut with the restriction endonucleases EcoRI and XbaI and the resulting DNA fragment of 412 bp was isolated. The yeast expression vector pKFN1627 was cut with

XbaI and the 184 bp fragment was isolated. The 412 bp EcoRI/XbaI fragment was then ligated to the two other fragments, that is the 9273 bp NcoI/XbaI fragment of the pKFN1627 vector and the

The ligation mixture was transformed into *E. coli* as described above. Plasmid from the resulting *E. coli* was isolated using standard techniques, and checked with appropriate restriction endonucleases i.e. EcoRI, XbaI, NcoI, Hpa I. The selected plasmid was shown by DNA sequence analysis (using the Sequenase kit as described by the manufacturer, U.S. Biochemical) to contain the correct sequence for the Ala<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor DNA and to be inserted after the DNA encoding the LaC212spx3 signal/leader DNA. The plasmid was named pEA5.3.2 and is shown in Fig. 1. The DNA sequence encoding the LaC212spx3 signal/leader/Ala<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor complex and the amino acid sequence thereof are SEQ ID NOS. 20, 21 and 22. The plasmid pEA5.3.2 was transformed into *S. cerevisiae* strain MT663 as described in European patent application having the publication No. 214826 and the resulting strain was named yEA002.

## EXAMPLE 2

Synthesis of Ala<sup>A21</sup> Thr<sup>B3</sup> human insulin precursor from Yeast strain yEA005 using the LaC212spx3 signal/leader.

The following oligonucleotides were synthesized:

- #101 5'-TGGCTAAGAGATTCGTTACTCAACACTTGTGCGGTTCTCACTT  
GGTTGAAGCTTTGTACTTGGTTTGTGGTGAAAGAGGTTTCTTCTACA  
CTCCAAAGTCTGACGACGCT-3' (Thr<sup>B3</sup>) (SEQ ID NO:7)
- #128 5'-CTGCGGGCTGCGTCTAAGCACAGTAGTTTTCCAATTGGTACAAA  
GAACAGATAGAAGTACAACATTGTTCAACGATACCCTTAGCGTCG  
TCAGACTTTGG-3' (Ala<sup>A21</sup>) (SEQ ID NO:4)
- #15 5'-GTCGCCATGGCTAAGAGATTCGTTA-3' (Thr<sup>B3</sup>) (SEQ ID NO:8)
- #16 5'-CTGCTCTAGAGCCTGCGGGCTGCGTCT-3' (SEQ ID NO:6)

The DNA encoding Ala<sup>A21</sup> Thr<sup>B3</sup> human insulin precursor was constructed in the same manner as described for the DNA encoding Ala<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor in Example 1. The DNA sequence encoding the LaC212spx3 signal/leader/Ala<sup>A21</sup> Thr<sup>B3</sup> human insulin precursor complex and the amino acid sequence thereof are SEQ ID NOS. 23, 24 and 25

### EXAMPLE 3

Synthesis of Gly<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor from Yeast strain yEA007 using the LaC212spx3 signal/leader.

The following oligonucleotides were synthesized:

- 5 #98 5'-TGGCTAAGAGATTCGTTGACCAACACTTGTGCGGTTCTCACTTG  
GTTGAAGCTTTGTACTTGGTTTGTGGTGAAAGAGGTTTCTTCT  
ACACTCCAAAGTCTGACGACGCT-3' (Asp<sup>B3</sup>) (SEQ ID NO:3)  
#127 5'-CTGCGGGCTGCGTCTAACCACAGTAGTTTTCCAATTGGTACAA  
AGAACAGATAGAAGTACAACATTGTTCAACGATACCCCT  
10 TAGCGTCGTCAGACTTTGG-3' (Gly<sup>A21</sup>) (SEQ ID NO:9)  
#126 5'-GTCGCCAATGGCTAAGAGATTCGTTG-3' (Asp<sup>B3</sup>) (SEQ ID NO:5)  
#16 5'-CTGCTCTAGAGCCTGCGGGCTGCGTCT-3' (SEQ ID NO:6)

15 The DNA encoding Gly<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor was constructed in the same manner as described for the DNA encoding Ala<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor in Example 1. The DNA sequence encoding the LaC212spx3 signal/leader/Gly<sup>A21</sup> Asp<sup>B3</sup> human insulin precursor complex and the amino acid sequence thereof are SEQ ID NOS. 26, 27 and 28. The plasmid pEA1.5.6 was shown to contain the desired sequence, transformed into *S. cerevisiae* strain MT663 as described in Example 1 and the resulting strain was named  
20 yEA007.

### EXAMPLE 4

Synthesis of Gly<sup>A21</sup> Thr<sup>B3</sup> human insulin precursor from Yeast strain yEA006 using the LaC212spx3 signal/leader.

25 The following oligonucleotides were synthesized:

- #101 5'-TGGCTAAGAGATTCGTTACTCAACACTTGTGCGGTTCTCACTTGGTTGAAG  
CTTTGTACTTGGTTTGTGGTGAAAGAGGTTTCTTCTACACTCCAAAGTCTGACG  
ACGCT-3' (Thr<sup>B3</sup>) (SEQ ID NO:7)

#102 5'-CTGCTCTAGAGCCTGCGGGCTGCGTCT-3'

30 #103 5'-TGGCTAAGAGATTCGTTACTCAACACTTGTGCGGTTCTCACTTGGTTGAAG

#104 5'-CTTGTACTTGGTTTGTGGTGAAAGAGGTTTCTTCTACACTCCAAAGTCTGACG

ACGCT-3' (Thr<sup>B3</sup>) (SEQ ID NO:8)

1. The DNA sequence encoding the LaC212spx3 signal/leader/Gly<sup>A21</sup> Thr<sup>B3</sup> human insulin precursor complex and the amino acid sequence thereof are SEQ ID NOS. 29, 30 and 31. The plasmid pEA4.4.11 was shown to contain the desired DNA sequence, transformed into *S. cerevisiae* strain MT663 as described in Example 1 and the resulting strain was named yEA006.

## EXAMPLE 5

Synthesis of Arg<sup>B-1</sup> Arg<sup>B31</sup> single chain human insulin precursor having an N-terminal extension (GluGluAlaGluAlaGluAlaArg) from Yeast strain yEA113 using the alpha factor leader.

A) The following oligonucleotides were synthesized:

#220 5'-ACGTACGTTCTAGAGCCTGCGGGCTGC-3' (SEQ ID NO:10)

#263 5'-CACTTGCTTGAAGCTTTGTACTTGTTTGTGGTGAAAGAGGTTTC  
TTCTACACTCCAAAGACTAGAGGTATCGTTGAA-3' (SEQ ID NO:11)

#307 5'-GCTAACGTCGCCATGGCTAAGAGAGAAGAAGCTGAAGCTGAAGCT  
AGATTCGTTAACCAACAC-3' (SEQ ID NO:12)

The following Polymerase Chain Reaction (PCR) was performed using the Gene Amp PCR reagent kit (Perkin Elmer, 761 Main Avewalk, CT 06859, USA) according to the manufacturer's instructions. In all cases, the PCR mixture was overlaid with 100  $\mu$ l of mineral oil (Sigma Chemical Co, St. Louis, MO, USA). The plasmid pAK220 (which is identical to pAK188) consists of a DNA sequence of 412 bp encoding the synthetic yeast signal/leader LaC212spx3 (described in Example 3 of WO 89/02463) followed by the insulin precursor MI5 (see SEQ ID NOS. 14, 15 and 16) inserted into the vector (phagemid) pBLUESCRIPT II sk(+/-) (Stratagene, USA).

5  $\mu$ l of oligonucleotide #220 (100 pmol)

5  $\mu$ l of oligonucleotide #263 (100 pmol)

10  $\mu$ l of 10X PCR buffer

16  $\mu$ l of dNTP mix

0.5  $\mu$ l of Taq enzyme

PCR cycles were performed, each cycle comprising 1 minute at 95°C, 1 minute at 40°C, and 2 minutes at 72°C. The PCR product was purified by gel electrophoresis.

fragment was cut out of the agarose gel and isolated using the Gene Clean kit (Bio 101 Inc., PO BOX 2284, La Jolla, CA 92038, USA) according to the manufacture's instructions. The purified PCR DNA fragment was dissolved in 10  $\mu$ l of water and restriction endonuclease buffer and cut with the restriction endonucleases HindIII and XbaI according to standard techniques. The HindIII/XbaI DNA fragment was purified using The Gene Clean Kit as described.

The plasmid pAK406 consists of a DNA sequence of 520 bp comprising an EcoRI/HindIII fragment derived from pMT636 (described in WO 90/10075) encoding the yeast alpha factor leader and part of the insulin precursor ligated to the HindIII/XbaI fragment from pAK188 encoding the rest of the insulin precursor MI5 (see SEQ ID NOS. 32, 33 and 34) inserted into the vector cPOT. The vector pAK406 is shown in Fig. 2.

The plasmid pAK233 consists of a DNA sequence of 412 bp encoding the synthetic yeast signal/leader LaC212spx3 (described in Example 3 of WO 89/02463) followed by the gene for the insulin precursor B(1-29)-GluLysArg-A(1-21) (A21-Gly) (see SEQ ID NOS. 35, 36 and 37) inserted into the vector cPOT. The plasmid pAK233 is shown in Fig. 2.

The plasmid pAK233 was cut with the restriction endonucleases NcoI and XbaI and the vector fragment of 9273 bp isolated. The plasmid pAK406 was cut with the restriction endonucleases NcoI and HindIII and the vector fragment of 2012 bp isolated. These two DNA fragments were ligated together with the HindIII/XbaI PCR fragment using T4 DNA ligase and standard conditions. The ligation mixture was then transformed into a competent *E. coli* strain (R-, M+) followed by selection for ampicillin resistance. Plasmids were isolated from the resulting *E. coli* colonies using a standard DNA miniprep technique and checked with appropriate restriction endonucleases i.e. EcoRI, XbaI, NcoI, HindIII. The selected plasmid was shown by DNA sequencing analyses to contain the correct sequence for the Arg<sup>831</sup> single chain human insulin precursor DNA and to be inserted after the DNA encoding the *S. cerevisiae* alpha factor DNA. The plasmid was named pEA108 and is shown in Fig. 2. The DNA sequence encoding the alpha factor leader/Arg<sup>831</sup> single chain human insulin precursor complex and the amino acid sequence thereof are SEQ ID NOS. 38, 39 and 40.

B) The following Polymerase Chain Reaction (PCR) was performed using the following primers:

manufacturer's instructions. In all cases, the PCR mixture was overlaid with 100  $\mu$ l of mineral oil (Sigma Chemical Co., St. Louis, MO, USA)

5  $\mu$ l of oligonucleotide #220 (100 pmol)

5  $\mu$ l of oligonucleotide #307 (100 pmol)

5 10  $\mu$ l of 10X PCR buffer

16  $\mu$ l of dNTP mix

0.5  $\mu$ l of Taq enzyme

0.2  $\mu$ l of pEA108 plasmid as template (0.1  $\mu$ g DNA)

63  $\mu$ l of water

10 A total of 16 cycles were performed, each cycle comprising 1 minute at 95°C; 1 minute at 40°C; and 2 minutes at 72°C. The PCR mixture was then loaded onto a 2% agarose gel and subjected to electrophoresis using standard techniques. The resulting DNA fragment was cut out of the agarose gel and isolated using the Gene Clean kit (Bio 101 Inc., PO BOX 2284, La Jolla, CA 92038, USA) according to the manufacture's instructions. The  
15 purified PCR DNA fragment was dissolved in 10  $\mu$ l of water and restriction endonuclease buffer and cut with the restriction endonucleases NcoI and XbaI according to standard techniques. The NcoI/XbaI DNA fragment was purified using The Gene Clean Kit as described.

The plasmid pAK401 consists of a DNA sequence of 523 bp composed of an  
20 EcoRI/NcoI fragment derived from pMT636 (described in WO 90/10075) (constructed by by introducing a NcoI site in the 3'-end of the alpha leader by site directed mutagenesis) encoding the alpha factor leader followed by a NcoI/XbaI fragment from pAK188 encoding the insulin precursor MI5 (see SEQ ID NOS. 41, 42 and 43) inserted into the vector (phagemid) pBLUESCRIPT IIsk(+/-) (Stratagene, USA). The plasmid pAK401 is shown in  
25 Fig. 3.

The plasmid pAK401 was cut with the restriction endonucleases NcoI and XbaI and the vector fragment of 3254 bp isolated and ligated together with the NcoI/XbaI PCR fragment. The ligation mixture was then transformed into a competent *E. coli* strain and

26 The plasmid pAK401 was cut with EcoRI and XbaI and the fragment of 535 bp isolated

were ligated together with the EcoRI/XbaI fragment from p113A using T4 DNA ligase and standard conditions. The ligation mixture was then transformed into a competent *E. coli* strain (R<sup>-</sup>, M<sup>+</sup>) followed by selection for ampicillin resistance. Plasmids were isolated from the resulting *E. coli* colonies using a standard DNA miniprep technique and checked with appropriate restriction endonucleases i.e. EcoRI, XbaI, NcoI, HindIII. The selected plasmid was shown by DNA sequencing analyses to contain the correct sequence for the Arg<sup>B31</sup> single chain human insulin precursor DNA with the N-terminal extension GluGluAlaGluAlaGluAlaArg and to be inserted after the DNA encoding the *S. cerevisiae* alpha factor DNA. The plasmid was named pEA113 and is shown in Fig. 3. The DNA sequence encoding the alpha factor leader/Arg<sup>B-1</sup> ArgB31 single chain human insulin precursor having an N terminal extension (GluGluAlaGluAlaGluAlaArg) and the amino acid sequence thereof are SEQ ID NOS. 44, 45 and 46. The plasmid pEA113 was transformed into *S. cerevisiae* strain MT663 as described in Example 1 and the resulting strain was named yEA113.

#### EXAMPLE 6

Synthesis of Arg<sup>B-1</sup> Arg<sup>B31</sup> single chain human insulin precursor having an N-terminal extension (GluGluAlaGluAlaGluAlaGluArg) from Yeast strain yEA136 using the alpha factor leader.

The following oligonucleotide was synthesized:

#389 5' -GCTAACGTGGCCATGGCTAAGAGAGAAGAAGCTGAAGCGAAGCTGAAAGATT  
CGTTAACCAACAC-3' (SEQ ID NO:13)

The following PCR was performed using the Gene Amp PCR reagent kit

5 µl of oligonucleotide #220 (100 pmol)

5 µl of oligonucleotide #389 (100 pmol)

10 µl of 10X PCR buffer

16 µl of dNTP mix

0.5 µl of Taq enzyme

2 µl of pEA113 plasmid

1 minute at 94 °C and 2 minutes at 72 °C

in the same manner as described for the DNA encoding alpha factor leader/Arg<sup>B-1</sup> Arg<sup>B31</sup> single chain human insulin precursor having an N-terminal extension (GluGluAlaGluAlaGluAlaArg) in Example 5. The plasmid was named pEA136. The DNA sequence encoding the alpha factor leader/Arg<sup>B-1</sup> Arg<sup>B31</sup> single chain human insulin precursor having an N-terminal extension (GluGluAlaGluAlaGluAlaGluArg) and the amino acid sequence thereof are SEQ ID NOS. 47, 48 and 49. The plasmid pEA136 was transformed into *S. cerevisiae* strain MT663 as described in Example 1 and the resulting strain was named yEA136.

## EXAMPLE 7

### Synthesis of (A1,B1)-diBoc human insulin.

5 g of zinc-free human insulin was dissolved in 41.3 ml of DMSO. To the solution was added 3.090 ml of acetic acid. The reaction was conducted at room temperature and initiated by addition of 565 mg of di-*tert*-butyl pyrocarbonate dissolved in 5.650 ml of DMSO. The reaction was allowed to proceed for 5½ hour and then stopped by addition of 250 µl of ethanolamine. The product was precipitated by addition of 1500 ml of acetone. The precipitate was isolated by centrifugation and dried in vacuum. A yield of 6.85 g material was obtained.

(A1,B1)-diBoc insulin was purified by reversed phase HPLC as follows: The crude product was dissolved in 100 ml of 25% ethanol in water, adjusted to pH 3.0 with HCl and applied to a column (5 cm diameter, 30 cm high) packed with octadecyldimethylsilyl-substituted silica particles (mean particle size 15 µm, pore size 100 Å) and equilibrated with elution buffer. The elution was performed using mixtures of ethanol and 1 mM aqueous HCl, 0.3 M KCl at a flow of 2 l/h. The insulin was eluted by increasing the ethanol content from 30% to 45%. The appropriate fraction was diluted to 20% ethanol and precipitated at pH 4.8. The precipitated material was isolated by centrifugation and dried in vacuum. Thus 1.701 g of (A1,B1)-diBoc human insulin was obtained at a purity of 94.5%.

## EXAMPLE 8

4.0 g of zinc-free human insulin was dissolved in 40 ml of DMSO. To the solution was added 1.48 ml of a mixture of N-methylmorpholine and DMSO (1:9 v/v). The

reaction was initiated by addition of 565 mg of di-*tert*-butyl pyrocarbonate dissolved in 5.650 ml of DMSO.

by addition of 100 ml of acetone. The precipitated material was isolated by centrifugation and dried in vacuum. 343 mg of material was collected.

The Boc protecting groups were eliminated by addition of 4 ml of TFA. The dissolved material was incubated for 30 minutes and then precipitated by addition of 50 ml of acetone. The precipitate was isolated by centrifugation and dried in vacuum.

N<sup>B29</sup>-benzoyl human insulin was purified by reversed phase HPLC as described in Example 7. A yield of 230 mg was obtained. Recrystallization from 15% aqueous ethanol containing 6 mM Zn<sup>2+</sup> and 50 mM citrate at pH 5.5 gave crystals of the title compound which were isolated by centrifugation and dried in vacuum. The yield was 190 mg.

Molecular mass, found by MS: 5911, theory: 5911.

## EXAMPLE 9

### Synthesis of (N<sup>B29</sup>-lithocholoyl human insulin)<sub>6</sub> · 3Zn<sup>2+</sup>.

400 mg of (A1,B1)-diBoc human insulin was dissolved in 2 ml of DMSO. To the solution was added 748 µl of a mixture of N-methylmorpholine and DMSO (1:9, v/v). The reaction was conducted at 15°C and initiated by addition of 31.94 mg of lithocholic acid N-hydroxysuccinimide ester dissolved in 300 µl of DMF. The reaction was stopped after 2 hours by addition of 100 ml of acetone. The precipitated material was isolated by centrifugation and dried in vacuum. 331 mg of material was obtained.

The Boc protecting groups were eliminated by addition of 4 ml of TFA. The dissolved material was incubated for 30 minutes and then precipitated by addition of 50 ml of acetone. The precipitate was isolated by centrifugation and dried in vacuum. The yield was 376 mg.

B29-lithocholoyl insulin was purified by reversed phase HPLC as described in Example 7. A final yield of 67 mg was obtained at a purity of 94%. Recrystallization from 15% aqueous ethanol containing 6 mM Zn<sup>2+</sup> and 50 mM citrate at pH 5.5 gave crystals of the title compound which were isolated by centrifugation and dried in vacuum. The yield was 49 mg.

Molecular mass, found by MS: 6160, theory: 6166.

### Synthesis of (N<sup>B29</sup>-lithocholoyl human insulin)<sub>6</sub> · 3Zn<sup>2+</sup>.

400 mg of (A1,B1)-diBoc human insulin was dissolved in 2 ml of DMSO. To the

solution was added 748 µl of a mixture of N-methylmorpholine and DMSO (1:9, v/v).

hydroxysuccinimide ester dissolved in 132  $\mu$ l of DMF. The reaction was stopped after 60 minutes and the product precipitated by addition of 100 ml of acetone. The precipitated material was isolated by centrifugation and dried in vacuum. 420 mg of intermediate product was collected.

5 The Boc protecting groups were eliminated by addition of 4 ml of TFA. The dissolved material was incubated for 30 minutes and the product was then precipitated by addition of 50 ml of acetone. The precipitate was isolated by centrifugation and dried in vacuum. The yield of crude product was 420 mg.

10 The crude product was purified by reversed phase HPLC as described in Example 7. A final yield of 254 mg of the title product was obtained. The purity was 96.1%. Recrystallization from 15% aqueous ethanol containing 6 mM  $Zn^{2+}$  and 50 mM citrate at pH 5.5 gave crystals of the title compound which were isolated by centrifugation and dried in vacuum. The yield was 217 mg.

Molecular mass, found by MS: 5962, theory: 5962.

## 15 EXAMPLE 11

### Synthesis of des(B30) human insulin.

20 Synthesis of des(B30) human insulin was carried out as described by Markussen (Methods in diabetes research, Vol. I, Laboratory methods, part B, 404-410. Ed: J. Larner and S. Phol, John Wiley & Sons, 1984). 5 g of human insulin was dissolved in 500 ml of water while the pH value of the solution was kept at 2.6 by addition of 0.5 M sulphuric acid. Subsequently, the insulin was salted out by addition of 100 g of ammonium sulphate and the precipitate was isolated by centrifugation. The pellet was dissolved in 800 ml of 0.1 M ammonium hydrogen carbonate and the pH value of the solution was adjusted to 8.4 with 1 M ammonia.

25 50 mg of bovine carboxypeptidase A was suspended in 25 ml of water and isolated by centrifugation. The crystals were suspended in 25 ml of water and 1 M ammonia was added until a clear solution was obtained at a final pH of 10. The carboxypeptidase solution

After 4 hours the des(B30) human insulin was crystallized by successive addition of 50 g of sodium chloride while the solution was stirred. The pH value was then adjusted to

crystals were isolated on a 1.2  $\mu$ m filter, washed with 250 ml of ice cold 2-propanol and finally dried in vacuum.

## EXAMPLE 12

### Synthesis of (A1,B1)-diBoc des(B30) human insulin.

The title compound was synthesized by a method similar to that described in Example 7, using des(B30) porcine insulin as the starting material. The crude product was precipitated by acetone and dried in vacuum. The (A1,B1)-diBoc des(B30) human insulin was purified by reversed phase HPLC as described in Example 7.

## EXAMPLE 13

### Synthesis of N<sup>B29</sup>-decanoyl des(B30) human insulin.

400 mg of (A1,B1)-diBoc des(B30) human insulin was used as starting material for the synthesis of N<sup>B29</sup>-decanoyl des(B30) human insulin, following the procedure described in Example 10. The crude product was precipitated by acetone, dried in vacuum and deprotected using TFA. The resulting product was precipitated by acetone and dried in vacuum. N<sup>B29</sup>-decanoyl des(B30) human insulin was then purified by reversed phase HPLC as described in Example 10.

Molecular mass, found by MS: 5856, theory: 5861.

## EXAMPLE 14

### Synthesis of N<sup>B29</sup>-dodecanoyl des(B30) human insulin.

#### a. Immobilization of *A. lyticus* protease

13 mg of *A. lyticus* protease, dissolved in 5 ml of aqueous 0.2 M NaHCO<sub>3</sub> buffer, pH 9.4, was mixed with 4 ml of settled MiniLeak<sup>®</sup> Medium gel, which had been washed with the same buffer (MiniLeak is a divinylsulfone activated Sepharose CL 6B, obtained from KemEnTec, Copenhagen). The gel was kept in suspension by gentle stirring for 24 hours at room temperature. Then, the gel was isolated by filtration, washed with water, and

assayed for proteolytic activity. The proteolytic activity in the filtrate was 17% of that in the initial solution, indicating a yield in the immobilization reaction of about 83%.

## b. Immobilization of porcine trypsin

Porcine trypsin was immobilized to MiniLeak<sup>®</sup> Low to a degree of substitution of 1 mg per ml of gel, using the conditions described above for immobilization of *A. lyticus*.

## c. Synthesis of Glu(GluAla)<sub>3</sub>Arg-B(1-29), ThrArg-A(1-21) insulin using immobilized *A. lyticus* protease

To 200 mg of Glu(GluAla)<sub>3</sub>Arg-B(1-29)-ThrArg-A(1-21) single-chain human insulin precursor, dissolved in 20 ml of 0.1 M NaHCO<sub>3</sub> buffer, pH 9.0, was added 4 ml of the gel carrying the immobilized *A. lyticus* protease. After the gel had been kept in suspension in the reaction mixture for 6 hours at room temperature the hydrolysis was complete, rendering Glu(GluAla)<sub>3</sub>Arg-B(1-29), ThrArg-A(1-21) human insulin (the reaction was followed by reversed phase HPLC). After the hydrolysis, the gel was removed by filtration. To the filtrate was added 5 ml of ethanol and 15  $\mu$ L of 1 M ZnCl<sub>2</sub> and the pH was adjusted to 5.0 using HCl. The precipitation of the product was completed on standing overnight at 4°C with gentle stirring. The product was isolated by centrifugation. After one washing with 1 ml of ice cold 20% ethanol and drying in vacuo the yield was 190 mg.

## d. Synthesis of N <sup>$\alpha$ A1</sup>, N <sup>$\alpha$ B1</sup>, N <sup>$\epsilon$ B29</sup>-tridodecanoyl Glu(GluAla)<sub>3</sub>Arg-B(1-29), Thr-Arg-A(1-21) human insulin using dodecanoic acid N-hydroxysuccinimide ester

190 mg (30  $\mu$ mol) of Glu(GluAla)<sub>3</sub>Arg-B(1-29), ThrArg-A(1-21) insulin was dissolved in 1 ml of DMSO and 1.05 ml of a 0.572 M solution of N,N-diisopropylethylamine in DMF. The solution was cooled to 15°C and 36 mg (120  $\mu$ mol) of dodecanoic acid N-hydroxysuccinimide ester dissolved in 0.6 ml of DMSO was added. The reaction was completed within 24 hours. The lipophilic title compound was not isolated.

## e. Synthesis of N <sup>$\epsilon$ B29</sup>-dodecanoyl des(B30) insulin

The product from the previous step, d., contained in approximately 2.65 ml of DMSO/DMF/N,N-diisopropylethylamine was diluted with 10.6 ml of a 50 mM glycine buffer comprising 20% ethanol and the pH adjusted to 10 with NaOH. After standing for 1

hour, the reaction mixture was applied to a reversed phase HPLC column (5 cm in diameter, 30  $\mu$ m beads, 10  $\mu$ m) with

an increasing concentration of ethanol, from 40% to 44% (v/v), at a rate of 2000 ml/h. The major peak eluting at about 43-44% of ethanol contained the title compound. The fractions containing the major peak were pooled, water was added to reduce the ethanol concentration to 20% (v/v), and the pH was adjusted to 5.5. The solution was left overnight at -20°C, whereby the product precipitated. The precipitate was isolated by centrifugation at -8°C and dried *in vacuo*. The yield of the title compound was 90 mg.

Molecular mass, found by MS: 5892, theory: 5890.

### EXAMPLE 15

#### Synthesis of N<sup>B29</sup>-(N-myristoyl- $\alpha$ -glutamyl) human insulin.

500 mg of (A1,B1)-diBoc human insulin was dissolved in 2.5 ml of DMSO and 428  $\mu$ l of ethyl diisopropylamine, diluted with 2.5 ml of DMSO/DMF 1/1 (v/v), was added. The temperature was adjusted to 15°C and 85 mg of N-myristoyl-Glu(OBut) N-hydroxy-succinimide ester, dissolved in 2.5 ml of DMSO/DMF 1/1 (v/v), was added. After 30 min the reaction mixture was poured into 60 ml of water, the pH adjusted to 5 and the precipitate isolated by centrifugation. The precipitate was dried *in vacuo*. The dried reaction mixture was dissolved in 25 ml of TFA, and the solution was left for 30 min at room temperature. The TFA was removed by evaporation *in vacuo*. The gelatinous residue was dissolved in 60 ml of water and the pH was adjusted to 11.2 using concentrated ammonia. The title compound was crystallized from this solution by adjustment of the pH to 8.5 using 6 N HCl. The product was isolated by centrifugation, washed once by 10 ml of water, and dried *in vacuo*. Yield 356 mg. Purity by HPLC 94%.

The product of this example is thus human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure:  $\text{CH}_3(\text{CH}_2)_{12}\text{CONHCH}(\text{CH}_2\text{CH}_2\text{COOH})\text{CO-}$

Molecular mass, found by MS: 6146, theory: 6148.

### EXAMPLE 16

This example is similar to Example 14, except using undecanoic acid N-hydroxy-succinimide ester instead of dodecanoic acid N-hydroxy-succinimide ester.

### EXAMPLE 17

#### Synthesis of N<sup>B29</sup>-tridecanoyl des(B30) human insulin.

The title compound was synthesized analogously to N<sup>B29</sup>-dodecanoyl des(B30) human insulin as described in Example 14, by using tridecanoic acid N-hydroxysuccinimide ester instead of dodecanoic acid N-hydroxysuccinimide ester.

Molecular mass of the product found by MS: 5899, theory: 5904.

### EXAMPLE 18

#### Synthesis of N<sup>B29</sup>-myristoyl des(B30) human insulin.

The title compound was synthesized analogously to N<sup>B29</sup>-dodecanoyl des(B30) human insulin as described in Example 14, by using myristic acid N-hydroxysuccinimide ester instead of dodecanoic acid N-hydroxysuccinimide ester.

Molecular mass of the product found by MS: 5923, theory: 5918.

### EXAMPLE 19

#### Synthesis of N<sup>B29</sup>-palmitoyl des(B30) human insulin.

The title compound was synthesized analogously to N<sup>B29</sup>-dodecanoyl des(B30) human insulin as described in Example 14, by using palmitic acid N-hydroxysuccinimide ester instead of dodecanoic acid N-hydroxysuccinimide ester.

Molecular mass of the product found by MS: 5944, theory: 5946.

### EXAMPLE 20

#### Synthesis of N<sup>B29</sup>-suberoyl-D-thyroxine human insulin.

##### a. Preparation of N-(succinimidylsuberoyl)-D-thyroxine.

Disuccinimidyl suberate (1.0 g, Pierce) was dissolved in DMF (50 ml), and D-thyroxine (2.0 g, Aldrich) was added with stirring at 20°C. The thyroxine slowly dissolved, and after 20 hours the solvent was removed by evaporation in vacuo. The oily residue was crystallized from 2 propanol to yield 0.6 g of N-(succinimidylsuberoyl)-D-thyroxine, m.p.

125-126°C.

At B1-dhBoc human insulin (200 mg) was dissolved in dry DMF (10 ml) by addition

of 10 ml of 1,2-dichloroethane. The solution was stirred for 1 hour at room temperature.

reaction was about 90% complete, the solvent was removed in vacuo. To the evaporation residue, anhydrous trifluoroacetic acid (5 ml) was added, and the solution was kept for 1 hour at room temperature. After removal of the trifluoroacetic acid in vacuo, the residue was dissolved in a mixture of 1M acetic acid (5 ml) and acetonitrile (1.5 ml), purified by preparative reversed phase HPLC and desalted on a PD-10 column. The yield of N<sup>B29</sup>-suberoyl-D-thyroxine human insulin was 50 mg.

The product of this example is thus human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure: Thyrox-CO(CH<sub>2</sub>)<sub>6</sub>CO-, wherein Thyrox is thyroxine which is bound to the octanedioic acid moiety via an amide bond to its  $\alpha$ -amino group.

Molecular mass of the product found by MS: 6724, theory: 6723.

## EXAMPLE 21

Synthesis of N<sup>B29</sup>-(2-succinylamido)myristic acid human insulin.

### a. Preparation of $\alpha$ -aminomyristic acid methyl ester, HCl.

To methanol (5 ml, Merck) at -10°C, thionyl chloride (0.2 ml, Aldrich) was added dropwise while stirring vigorously. Then,  $\alpha$ -aminomyristic acid (0.7 g, prepared from the  $\alpha$ -bromo acid by reaction with ammonia) was added. The reaction mixture was stirred at room temperature overnight, and then evaporated to dryness. The crude product (0.7 g) was used directly in step b.

### b. Preparation of N-succinoyl- $\alpha$ -aminomyristic acid methyl ester.

$\alpha$ -Aminomyristic acid methyl ester, HCl (0.7 g) was dissolved in chloroform (25 ml, Merck). Triethylamine (0.35 ml, Fluka) was added, followed by succinic anhydride (0.3 g, Fluka). The reaction mixture was stirred at room temperature for 2 hours, concentrated to dryness, and the residue recrystallized from ethyl acetate/petroleum ether (1/1). Yield: 0.8 g.

### c. Desalting of N<sup>B29</sup>

To a solution of N-succinoyl- $\alpha$ -aminomyristic acid methyl ester (0.8 g, Merck) and N-succinyl-L-phenylalanyl-L-proline (0.8 g, Fluka) were added, and the reaction mixture was stirred

(1/1). Yield of N-(succinimidylsuccinoyl)- $\alpha$ -aminomyristic acid methyl ester: 0.13 g, m.p. 64-66°C.

d. Reaction of (A1,B1)-diBoc human insulin with N-(succinimidylsuccinoyl)- $\alpha$ -aminomyristic acid methyl ester.

The reaction was carried out as in Example 20 b., but using N-(succinimidylsuccinoyl)- $\alpha$ -aminomyristic acid methyl ester (16 mg) instead of N-(succinimidylsuberoyl)-D-thyroxine. After removal of the trifluoroacetic acid in vacuo, the evaporation residue was treated with 0.1M sodium hydroxide at 0°C to saponify the methyl ester. When the saponification was judged to be complete by reversed phase HPLC, the pH value in the solution was adjusted to 3, and the solution was lyophilized. After purification by preparative reversed phase HPLC and desalting on a PD-10 column, the yield of N<sup>B29</sup>-(2-succinylamido)myristic acid human insulin was 39 mg.

The product of this example is thus human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure:  $\text{CH}_3(\text{CH}_2)_{11}\text{CH}(\text{COOH})\text{NHCOCH}_2\text{CH}_2\text{CO}-$

Molecular mass of the product found by MS: 6130, theory: 6133.

## EXAMPLE 22

Synthesis of N<sup>B29</sup>-octyloxycarbonyl human insulin.

The synthesis was carried out as in Example 20 b., but using n-octyloxycarbonyl N-hydroxysuccinimide (9 mg, prepared from n-octyl chloroformate (Aldrich) and N-hydroxysuccinimide), instead of N-(succinimidylsuberoyl)-D-thyroxine. The yield of N<sup>B29</sup>-octyloxycarbonyl human insulin was 86 mg.

The product of this example is thus human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure:  $\text{CH}_3(\text{CH}_2)_7\text{OCO}-$ .

Molecular mass of the product found by MS: 5960, theory: 5964.

## EXAMPLE 23

Synthesis of N<sup>B29</sup>-(2-succinylamido)myristic acid human insulin.

This compound was prepared as described in Example 21 a. c., using 1 amino-

b. Reaction of (A1,B1)-diBoc human insulin with N-(succinimidylsuccinoyl)- $\alpha$ -aminopalmitic acid methyl ester.

The reaction was carried out as in Example 21 d., but using N-(succinimidylsuccinoyl)- $\alpha$ -aminopalmitic acid methyl ester instead of N-(succinimidylsuccinoyl)- $\alpha$ -aminopalmitic acid methyl ester to give N<sup>B29</sup>-(2-succinylamido)palmitic acid human insulin.

The product of this example is thus human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure:  $\text{CH}_3(\text{CH}_2)_{13}\text{CH}(\text{COOH})\text{NHCOCH}_2\text{CH}_2\text{CO}-$

#### EXAMPLE 24

Synthesis of N<sup>B29</sup>-(2-succinylamidoethoxy)palmitic acid human insulin.

a. Preparation of N-(succinimidylsuccinoyl)-2-aminoethoxy palmitic acid methyl ester.

This compound was prepared as described in Example 21 a.-c. but using 2-aminoethoxy palmitic acid (synthesized by the general procedure described by R. TenBrink, *J. Org. Chem.* 52 (1987) 418-422 instead of  $\alpha$ -amino myristic acid.

b. Reaction of (A1,B1)-diBoc human insulin with N-(succinimidylsuccinoyl)-2-aminoethoxypalmitic acid methyl ester.

The reaction was carried out as in Example 21 d., but using N-(succinimidylsuccinoyl)-2-aminoethoxypalmitic acid methyl ester instead of N-(succinimidylsuccinoyl)- $\alpha$ -aminomyristic acid methyl ester to give N<sup>B29</sup>-(2-succinylamidoethoxy)palmitic acid human insulin.

The product of this example is thus human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure:  $\text{CH}_3(\text{CH}_2)_{13}\text{CH}(\text{COOH})\text{NHCH}_2\text{CH}_2\text{OCOCH}_2\text{CH}_2\text{CO}-$ .

#### EXAMPLE 25

Synthesis of N<sup>B29</sup>-(2-succinylamidoethoxy)palmitic acid human insulin.

a. Preparation of N-(succinimidylsuccinoyl)-2-aminoethoxy palmitic acid methyl ester.

The product of this example is thus des(B30) human insulin wherein the  $\epsilon$ -amino group of Lys<sup>B29</sup> has a substituent of the following structure: lithocholoyl-NHCH(CH<sub>2</sub>CH<sub>2</sub>COOH)CO-.

Molecular mass of the product found by MS: 6194, theory: 6193.

#### EXAMPLE 26

Synthesis of N<sup>B29</sup>-3,3',5,5'-tetraiodothyroacetyl human insulin.

The synthesis was carried out as in Example 10 using 3,3',5,5'-tetraiodothyroacetic acid N-hydroxysuccinimide ester, instead of decanoic acid N-hydroxysuccinimide ester.

Molecular mass of the product found by MS: 6536, theory: 6538.

#### EXAMPLE 27

Synthesis of N<sup>B29</sup>-L-thyroxyl human insulin.

The synthesis was carried out as in Example 10 using Boc-L-thyroxine N-hydroxysuccinimide ester, instead of decanoic acid N-hydroxysuccinimide ester.

Molecular mass of the product found by MS: 6572, theory: 6567.

#### EXAMPLE 28

A pharmaceutical composition comprising 600 nmol/ml of N<sup>B29</sup>-decanoyl des(B30) human insulin, 1/3Zn<sup>2+</sup> in solution.

N<sup>B29</sup>-decanoyl des(B30) human insulin (1.2  $\mu$ mol) was dissolved in water (0.8 ml) and the pH value was adjusted to 7.5 by addition of 0.2 M sodium hydroxide. 0.01 M zinc acetate (60  $\mu$ l) and a solution containing 0.75% of phenol and 4% of glycerol (0.8 ml) was added. The pH value of the solution was adjusted to 7.5 using 0.2 M sodium hydroxide and the volume of the solution was adjusted to 2 ml with water.

The resulting solution was sterilized by filtration and transferred aseptically to a cartridge or a vial.

phenol and 1.75% of sodium chloride (0.8 ml) was added. The pH value of the solution was adjusted to 7.5 using 0.2 M sodium hydroxide and the volume of the solution was adjusted to 2 ml with water.

The resulting solution was sterilized by filtration and transferred aseptically to a cartridge or a vial.

### EXAMPLE 30

A pharmaceutical composition comprising 600 nmol/ml of N<sup>B29</sup>-lithocholoyl human insulin in solution.

1.2  $\mu$ mol of the title compound was suspended in water (0.8 ml) and dissolved by adjusting the pH value of the solution to 8.5 using 0.2 M sodium hydroxide. To the solution was then added 0.8 ml of a stock solution containing 0.75 % cresol and 4% glycerol in water. Finally, the pH value was again adjusted to 8.5 and the volume of the solution was adjusted to 2 ml with water.

The resulting solution was sterilized by filtration and transferred aseptically to a cartridge or a vial.

### EXAMPLE 31

A pharmaceutical composition comprising a solution of 600 nmol/ml of N<sup>B29</sup>-hexadecanoyl human insulin, 1/3 zinc ion per insulin monomer, 16 mM m-cresol, 16 mM phenol, 1.6% glycerol, 10 mM sodium chloride and 7 mM sodium phosphate.

1.2  $\mu$ mol of N<sup>B29</sup>-hexadecanoyl human insulin was dissolved in water (0.5 ml) by addition of 0.2 M sodium hydroxide to pH 8.0 and 40  $\mu$ l of 0.01 M zinc acetate was added. To the solution was further added 100  $\mu$ l of 0.32 M phenol, 200  $\mu$ l of 0.16 M m-cresol, 800  $\mu$ l of 4% glycerol, 33.3  $\mu$ l of 0.6 M sodium chloride, and 140  $\mu$ l of 0.1 M sodium phosphate (pH 7.5). The pH value of the solution was adjusted to 7.5 with 0.1 M hydrochloric acid and the volume adjusted to 2 ml with water.

### EXAMPLE 32

The solubility of N<sup>B29</sup>-tetradecanoyl des(B30) human insulin and N<sup>B29</sup>-hexadecanoyl

Zinc acetate was either left out or an amount corresponding to  $1/3 \text{ Zn}^{2+}$  per insulin monomer was used. Sodium chloride was used in amounts which resulted in a final concentration of 5, 25, 50, 75, 100 or 150 mM of sodium chloride. Zinc-free insulin was added to give a final amount in the composition of 1000 nmol/ml. In some cases a precipitate formed. The resulting solutions and suspensions were kept at  $4^\circ\text{C}$  for a week and the concentration of insulin in solution in each composition was then measured by high performance size exclusion chromatography relative to a standard of human insulin (column: Waters ProteinPak 250x8 mm; eluent: 2.5 M acetic acid, 4 mM arginine, 20% acetonitrile; flow rate: 1 ml/min; injection volume:  $40 \mu\text{l}$ ; detection: UV absorbance at 276 nm). The results, in nmol/ml, are given in the table below:

| Solubility of insulins (nmol/ml) in 16 mM phenol, 16 mM m-cresol, 1.6% glycerol, 7 mM sodium phosphate, and pH 7.5, varying zinc acetate and sodium chloride (mM) concentrations at $4^\circ\text{C}$ . | Sodium chloride |       |       |       |        |        |
|---|-----------------|-------|-------|-------|--------|--------|
|   | 5 mM            | 25 mM | 50 mM | 75 mM | 100 mM | 150 mM |
| $\text{N}^{\text{B29}}$ -tetradecanoyl des(B30) human insulin, zinc-free.   | 82              | 115   | 54    | 77    | 74     | 84     |
| $\text{N}^{\text{B29}}$ -tetradecanoyl des(B30) human insulin, $1/3 \text{ Zn}^{2+}$ per insulin monomer.   | > 950           | > 950 | > 950 | > 950 | > 950  | 485    |
| $\text{N}^{\text{B29}}$ -hexadecanoyl human insulin, zinc-free.   | > 890           | > 950 | 283   | 106   | 45     | 29     |
| $\text{N}^{\text{B29}}$ -hexadecanoyl human insulin, $1/3 \text{ Zn}^{2+}$ per insulin monomer.   | > 950           | > 950 | > 950 | > 950 | 920    | 620    |

In conclusion, it was found

### EXAMPLE 33

#### Preparative crystallization of zinc-free N<sup>ε</sup>-B<sup>29</sup>-tetradecanoyl des(B30) human insulin.

10 g of N<sup>ε</sup>-B<sup>29</sup>-tetradecanoyl des(B30) human insulin was dissolved in 120 ml of 0.02 M NH<sub>4</sub>Cl buffer adjusted to pH 9.0 with NH<sub>3</sub> in ethanol/water (1:4, v/v). Gentle stirring was maintained throughout the crystallization. Crystallization was initiated at 23°C by addition of 20 ml of 2.5 M NaCl dissolved in ethanol/water (1:4, v/v). A slight turbidity appeared in the solution. Further, 20 ml of 2.5 M sodium chloride dissolved in ethanol/water (1:4, v/v) was added at a constant rate of 5 ml/h, which caused the crystallization to proceed slowly. In order to decrease the solubility of the insulin, the pH value was then adjusted to 7.5 using 1 N hydrochloric acid. Finally, the temperature was lowered to 4°C and the stirring continued overnight. The crystals were collected by filtration, washed twice with 25 ml of 0.2 M NaCl in ethanol/water (1:4, v/v), sucked dry and lyophilized.

The weight of the wet filter cake was 19.33 g.

The weight of lyophilized filter cake was 9.71 g.

### EXAMPLE 34

#### Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-tetradecanoyl-Glu-Gly-]) des(B30) human insulin.

500 mg of (A1,B1)-diBoc human insulin was dissolved in a mixture of 186 μl of 4-methylmorpholine and 3814 μl of DMSO. The reaction was initiated by addition of 144 mg of tetradecanoyl-Glu(γ-OtBu)-Gly-OSu dissolved in 1000 μl of DMF. The reaction conducted at 15°C and it was stopped after 4.5 hours by addition of 100 ml of acetone. The reaction product precipitated by addition of a few drops of concentrated HCl was subsequently isolated by centrifugation. The precipitate was then suspended in 100 ml of acetone, isolated by centrifugation and dried in vacuum. 637 mg of material was obtained.

The Boc protecting groups were eliminated by addition of 5 ml of TFA. The dissolved material was incubated for 30 minutes and then precipitated by addition of 100 ml of acetone and a few drops of concentrated HCl. The precipitate was then suspended in 100 ml acetone and isolated by centrifugation. The precipitated material was dissolved in 200 ml of 25% ethanol at pH 8 by addition of 56 N HCl.

The solution was then adjusted to pH 7.3 with 1 N NaOH and equilibrated with 0.02 M Bis-Tris, 33% ethanol adjusted to pH 7.3 with hydrochloric acid.

100 μl of the solution was injected into a

ethanol content from 30% to 50% and the effluent was monitored by its UV absorbance at 280 nm. The appropriate fraction was diluted to 20% ethanol adjusted to pH 4.5 and frozen at -20°C. The precipitated material was isolated after equilibration of the sample at 1°C and subsequent centrifugation at the same temperature. The precipitate was dried in vacuum.

Thus 292 mg of the title compound was obtained at a purity of 95.5%.

Molecular mass, found by MS:  $6102 \pm 6$ , theory: 6103.

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 20$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 11.9 hours. The determination was carried out as described on page 24 of the description using a composition similar to those described in Table 2 on page 26 of the description.

### EXAMPLE 35

#### Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-tetradecanoyl-Glu-) des(B30) human insulin.

500 mg of (A1,B1)-diBoc human insulin was dissolved in a mixture of 186  $\mu$ l of 4-methylmorpholine and 3814  $\mu$ l of DMSO. The reaction was initiated by addition of 85 mg of N<sup>ε</sup>-tetradecanoyl-Glu(OtBu)-OSu dissolved in 1000  $\mu$ l of DMF. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. The intermediate product was isolated and the protection groups were removed by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

Thus 356 mg of the title compound was obtained at a purity of 94.1%. Molecular mass, found by MS:  $6053 \pm 6$ , theory: 6046.

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 24$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 8.8 hours. The determination was carried out as described on page 24 of the description.

### EXAMPLE 36

#### Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-tetradecanoyl-Glu(-)-OH]) human insulin.

400 mg of (A1,B1)-diBoc human insulin was dissolved in a mixture of 232  $\mu$ l of ethyldiisopropylamine, 1880  $\mu$ l of DMSO and 2088  $\mu$ l of 1-methyl-2-pyrrolidone. The reaction was initiated by addition of 138 mg of N<sup>α</sup>-tetradecanoyl-Glu(OSu)-OtBu dissolved in 800  $\mu$ l of 1-methyl-2-pyrrolidone. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. The protection groups were removed from the intermediate product by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

Thus 222 mg of the title compound was obtained at a purity of 95.5%. Molecular mass, found by MS:  $6150 \pm 6$ , theory: 6147

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 21$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 8.0 hours. The determination was carried out as described on page 24 of the description using a composition similar to the one described in the present Example 31.

### EXAMPLE 37

#### Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-hexadecanoyl-Glu(-)-OH]) human insulin.

400 mg of (A1,B1)-diBoc human insulin was dissolved in a mixture of 232  $\mu$ l of ethyldiisopropylamine, 880  $\mu$ l of DMSO and 2088  $\mu$ l of 1-methyl-2-pyrrolidone. The reaction was initiated by addition of 73 mg of N<sup>α</sup>-hexadecanoyl-Glu(OSu)-OtBu dissolved in 800  $\mu$ l of DMF. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. 476 mg of intermediate product was obtained. The protection groups were removed from the intermediate product by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

Thus 222 mg of the title compound

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 21$ . The determination was carried out as described on page 23 of the description.

Thus 222 mg

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 8.0 hours.

24 of the description using a composition similar to the one described in the present Example 31.

### EXAMPLE 38

5 Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-octadecanoyl-Glu(-)-OH]) des(B30) human insulin.

400 mg of (A1,B1)-diBoc des(B30) human insulin was dissolved in a mixture of 232  $\mu$ l of ethyldiisopropylamine, 3000  $\mu$ l of DMSO and 268  $\mu$ l of dimethylformamide. The reaction was initiated by addition of 114 mg N<sup>α</sup>-octadecanoyl-Glu(OSu)-OtBu dissolved in 500  $\mu$ l of DMF. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The  
10 remaining process steps were performed as described in Example 34. 420 mg of intermediate product was obtained. The protection groups were removed from the intermediate product by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

Thus 169 mg of the title compound was obtained at a purity of 93.3%. Molecular  
15 mass, found by MS: 6103 $\pm$ 5, theory: 6102.

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 185$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 9.7 hours. The determination was carried out as described on page  
20 24 of the description using a composition similar to the one described in the present Example 31.

### EXAMPLE 39

25 Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-tetradecanoyl-Glu(-)-OH]) des(B30) human insulin.

400 mg of (A1,B1)-diBoc des(B30) human insulin was dissolved in a mixture of 232  $\mu$ l of ethyldiisopropylamine and 3000  $\mu$ l of DMSO. The reaction was initiated by addition of 138 mg of N<sup>α</sup>-tetradecanoyl-Glu(OSu)-OtBu dissolved in 768  $\mu$ l of DMF. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34.

Thus 237 mg of the title compound was obtained at a purity of 96.7%. Molecular

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 21$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 12.8 hours. The determination was carried out as described on page 24 of the description using a composition similar to the one described in the present Example 31.

#### EXAMPLE 40

##### Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-hexadecanoyl-Glu(-)-OH]) des(B30) human insulin.

400 mg of (A1,B1)-diBoc des(B30) human insulin was dissolved in a mixture of 232  $\mu$ l of ethyldiisopropylamine, 3000  $\mu$ l of DMSO and 400  $\mu$ l of dimethylformamide. The reaction was initiated by addition of 73 mg of N<sup>α</sup>-hexadecanoyl-Glu(OSu)-OtBu dissolved in 400  $\mu$ l of DMF. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. The protection groups of the intermediate product were removed by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

Thus 153 mg of the title compound was obtained at a purity of 95.2%. Molecular Mass, found by MS:  $6073 \pm 6$ , theory: 6074.

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 67$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 18.0 hours. The determination was carried out as described on page 24 of the description using a composition similar to the one described in the present Example 31.

#### EXAMPLE 41

##### Synthesis of Lys<sup>B29</sup>(N<sup>ε</sup>-[N<sup>α</sup>-lithocholyl-Glu(-)-OH]) des(B30) human insulin.

400 mg of (A1,B1)-diBoc des(B30) human insulin was dissolved in a mixture of 148  $\mu$ l of triethylamine, 3000  $\mu$ l of DMSO and 400  $\mu$ l of dimethylformamide.

The reaction was initiated by addition of 49 mg of N<sup>α</sup>-lithocholyl-Glu(OSu)-OtBu dissolved in 400  $\mu$ l of DMF. The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. 493 mg of intermediate product was obtained. The

Thus 209 mg of the title compound was obtained at a purity of 97.4%. Molecular Mass, found by MS:  $6185 \pm 10$ , theory: 6194.

#### EXAMPLE 42

5 Lys<sup>B29</sup>(N'-[N'-tetradecanoyl Aad(-)-OH]) des(B30) human insulin.

Aad is 5-aminohexadioic acid. 347 mg of (A1,B1)-diBoc des(B30) human insulin was dissolved in a mixture of 129  $\mu$ l of 4-methylmorpholine and 2645  $\mu$ l of DMSO. The reaction was initiated by addition of 58 mg of N'-tetradecanoyl-Aad(OSu)-OtBu dissolved in 694  $\mu$ l of DMF. The activated ester was prepared in analogy with chemistry well-known from aspartic acid derivatisation (L. Benoiton: Can.J.Chem.40,570-72,1962, R.Roeske: J.Org.Chem 28 1251-93 (1963)). The reaction was conducted at 15°C and it was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. The protection groups of the intermediate product were removed by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

15 Thus 149 mg of the title compound was obtained at a purity of 97.9%. Molecular Mass, found by MS:  $6061 \pm 2$ , theory: 6060.

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 21$ . The determination was carried out as described on page 23 of the description.

The disappearance half-life,  $T_{50\%}$ , of the title compound after subcutaneous injection in pigs was found to be 16.1 hours. The determination was carried out as described on page 24 of the description using a composition similar to the one described in the present Example 31.

#### EXAMPLE 43

20 Synthesis of Lys<sup>B29</sup>(N'-[N'-tetradecanoyl- $\gamma$ -carboxy-Glu-]) des(B30) human insulin.

400 mg of (A1,B1)-diBoc des(B30) human insulin was dissolved in a mixture of 190  $\mu$ l of triethylamine and 3000  $\mu$ l of DMSO. The reaction was initiated by addition of 83 mg of  $\gamma$ -carboxy Glu N-tetradecansyre  $\gamma,\gamma'$ -di(OtBu)  $\alpha$ -(OSu) (i.e. (tBuOCO)<sub>2</sub>CHCH<sub>2</sub>-CH<sub>2</sub>COOSu) NH<sub>2</sub>CO<sub>2</sub>CH<sub>2</sub>-CH<sub>2</sub>-OH.

The reaction was stopped after 4.5 hours. The remaining process steps were performed as described in Example 34. The protection groups of the intermediate product were removed by TFA before purification by RP-HPLC and final isolation by precipitation and vacuum drying.

63 mg of the title compound were obtained. Molecular Mass, found by MS:  $6090 \pm 3$ , theory: 6091.

The lipophilicity of the title compound, relative to human insulin,  $k'_{rel} = 10$ . The determination was carried out as described on page 23 of the description.

(2) INFORMATION FOR SEQ ID NO:21:

- (i) SEQUENCE CHARACTERISTICS:  
 (A) LENGTH: 104 amino acids  
 (B) TYPE: amino acid

Seq. ID NO: 21: Amino acid sequence of the protein encoded by the cDNA sequence shown above. The sequence is identical to the one reported in the literature (Genbank accession number X12345).

(2) INFORMATION FOR SEQ ID NO:47:

- (i) SEQUENCE CHARACTERISTICS:  
 (A) LENGTH: 538 base pairs  
 (B) TYPE: nucleic acid  
 (C) STRANDEDNESS: single  
 (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: cDNA

- (ix) FEATURE:  
 (A) NAME/KEY: CDS  
 (B) LOCATION: 77..514

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:47:
